Application: Software Developer

Ravion Nordic AB, Stockholm

Hello,

I'm a Java developer focused on Spring Boot back-end services, with experience building, containerising and deploying microservices in a health-tech environment and three years of earlier software development in research. Your Software Developer role matches the core of my work: Java and Spring, RESTful APIs, and getting Java applications running reliably in the cloud.

The clearest example of how I work is Skepparklar, an e-learning platform for Swedish boating licence courses that I built from scratch. The back end is a REST API in Java 21 and Spring Boot 4 on PostgreSQL, the front end is React and TypeScript, and payments run through Stripe with webhooks. Every change goes through a GitHub Actions pipeline and is deployed automatically to a Linux server behind nginx and Cloudflare. Because I run it on my own, I've had to own the whole chain, from design to fixing things in production.

During my internship at Braive I built and deployed Spring Boot microservices in Java and Kotlin, containerised them with Docker and shipped them through Kubernetes-based pipelines. I also tracked down and fixed race conditions in the logging flows. At Omika Health I built a peer-to-peer video chat with WebRTC and secure authentication. I haven't worked with J2EE or NoSQL databases such as MongoDB or Cosmos DB yet, but my relational database and Spring background is solid, and I'd be glad to learn them on the job.

I like working in teams where people help each other and talk openly about problems. Working as a prison officer and as a lab teacher taught me to stay calm and careful under pressure, and I have passed a security vetting under the Swedish Protective Security Act. English is my native language and I speak and write Swedish fluently. When I'm not coding I'm usually out on the water, which may explain why my biggest side project is about boats.

Thank you for considering my application. I hope to hear from you.

Kind regards,

Cai Birch
